

Evolve to Next-Level Detection and Response

A hacker's first step is to find vulnerabilities to gain control of user accounts and credentials to access more valuable data. Appearing as normal user activity, malicious actions go undetected, increasing the likelihood of a disastrous data incident or business shutdown.

Hackers are adept at bypassing firewalls and signature-based antivirus

Too many businesses rely only on traditional firewall and signature-based antivirus for security. With no ability to detect internal attacker movement, the risk of a data incidents increases significantly.

Organisations can greatly strengthen their defence in-depth with the addition of Endpoint Detection and Response (EDR) services. EDR solutions help detect and respond to advanced threats and provide better visibility into systems. EDR offers a comprehensive view and protection , and should be part of any company's progression for complete security.

EDR detects and responds to malicious activities other tools miss
